A

A layered map of recoverable information

INTRINSIC SUBSTRATE

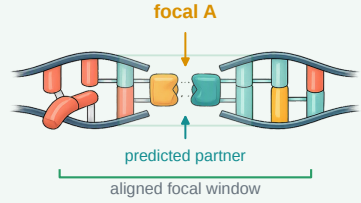

sequence · base pairing · predicted fold

strong recoverable signal

TARGET SELECTIVITY

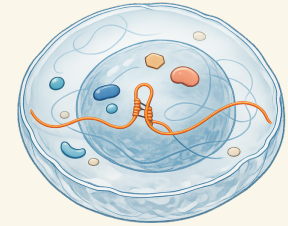

focal A · predicted partner · aligned window

target centering adds information

CELLULAR / TRANSCRIPT CONTEXT

transcript state · ADAR access · regulators

tested bulk proxies add little residual signal

OBSERVED ENDOGENOUS EDITING

B

Controlled questions, not model parts

1. **BIOLOGICAL CONTEXT**
   Do measured cellular annotations add residual information?
2. **SUPERVISION**
   Does respecting duplex organization alter what is learned?
3. **REPRESENTATION**
   What is lost between global duplex and focal-site views?
4. **GENERALIZATION**
   Which determinants transfer, and where do they fail?

C

Evidence was separated from final validation

GLOBAL PAIR-LEVEL PARTITION
